

# Trends And Variability Of Major Fruits Production In Khyber Pakhtunkhwa, Pakistan

<sup>1</sup>Prof. Qamruz Zaman, <sup>1</sup>Abdur Rehman Sabir, <sup>2</sup>Syed Asghar Ali Shah, <sup>3</sup>Soofia Iftikhar, <sup>1</sup>Neelam, <sup>1</sup>Muhammad Waqas, <sup>4</sup>Abdul Majid, <sup>5</sup>Syed Habib Shah

## ABSTRACT

*The present study investigates major fruit production trends and analyzes variability in Khyber Pakhtunkhwa. The study based on secondary data covers a period of about 34 years i.e. starting from 1980-81 to 2013-14, whereas, the trend models and Cuddy Della Vella Index techniques have been employed to fit the best trend model and variability analysis<sup>1</sup> respectively for major fruits production i.e. Apple, Citrus, Peach, Pear, Plum. Among the studied trend models regarding major fruit production, the power trend model, Cubic trend model, Exponential trend model, Cubic trend model, and Cubic trend model respectively were found adequate for forecasting based on the forecast evaluation criteria (MAD, MSE, and MAPE). Moreover, the variability analysis for each major fruit crop production was 2.46%, 0.27%, 24.07%, 2.20%, and 0.84% respectively.*

**Keywords:** *Parameter estimates, Accuracy Measures, Variability, Cuddy-Della Valle Index, Fruit.*

## Introduction:

The agriculture sector plays a significant role in the economy of a country. Agriculture occupies a central position in Pakistan and contributes nearly 20.9% to the GDP. About 43.5% of the labor force is engaged in agriculture (Pakistan Economic Survey, 2014-2015). One of the main components of agriculture is horticulture. The horticulture industry play pivotal role in the development of economy of every country and particularly, in Pakistan it greatly contribute in the social as well as economic development by improving the income status of individuals and add nutritional values in the context of their good health. Among the other associated benefits, orchards having pleasant effect on the environment and by maintaining ecological balance. The horticultural sector mainly includes fruits and vegetables, contributing 11% to the total value addition of the agriculture sector of Pakistan. Major horticulture crops of our country are mainly grown on the area of about 0.812 million hectares, which is approximately 5% of the total cultivable land of the country. Also, the current income status of exports of horticultural sector is recorded to be 400 million USD which significantly contributes and laid down foundation towards the growth of economy. The horticulture crops are very labor intensive in nature and the country like Pakistan where there is lake of resources including capital scarcity

and labor abundant, the production of the horticultural products should be encouraged to improve the economy and also to alleviate poverty. Pakistan is sacred with variety of suitable climatic situations to produce different types of horticultural products by the help of which demands of national and international markets can easily be fulfilled (Pakistan Horticultural Development and Export Board, 2011).

Especially, Khyber Pakhtunkhwa is gifted with the natural ecology and its land is favorable to grow different fine varieties of fruits and vegetables. It has vast mountainous area naturally suitable for growing precious quality of dry fruits like pine-nuts, wall-nuts and almond etc. Besides that it produces sweet and delicious oranges, persimmons, peaches, plums, apples, pears and pomegranate due to its favorable climatic situation. Like-wise in plain areas guava, citrus, strawberry, loquat, apricot, dates, melons and plums are abundantly produced. The production of apples, peaches, plums, pomegranate, dates, grapes, and persimmon have strong market demand in the domestic markets. In the citrus fruits, kinnow variety “mandarin” is the large producing fruit in Khyber Pakhtunkhwa and having great source of revenue earning. Moreover, in some Northern areas of Khyber Pakhtunkhwa there are significantly great potential for different types of fruits. Pakistan is the fifth largest producer of dates. Though the production of mangoes is in millions of tons annually, but the exported potential of the same is very low. In Khyber Pakhtunkhwa, the Northern areas having potential for the promotion of peaches, apples, guava, strawberry, citrus, persimmon, apricot and plums etc. Also, there is a great room for the growth and development of some altered fruits like strawberries, cherries, litchi etc. in different regions of our country. (Crop Reporting Service Khyber Pakhtunkhwa, 2013). According to Sen (1967) observed the variability phenomena of different fruit crops in India. He employed variability measures and concluded that the agricultural production was significantly increased due to improved usage of purchased inputs and also caused expansion in the cultivation related to the marginal land and resources. Similarly, Rao (1975) compared the variability in yield and area of different fruit crops of India. He concluded that variability in productivity was much greater than the variability in the corresponding area due to shifting growth components based upon increasing area related to growth. Moreover, Hazell (1982 and 1989) conducted a study related to food crops of India. He concluded that due to the vast scope and adoption of modern prevailing technology, the variability in the production of world cereal, as well as Indian food grain, was found to be increased. In literature different studies have also been employed regarding the trend model by Boken et al. (2000), Finger (2007), Rimi et al. (2011), Sorva et. al. (1990), Pere (2000), and Rao et al. (1980).

### **Material and Method:**

The present study is conducted by using time series data with effect from 1980-81 to 2013-14 i.e. time series data of 34 years, to forecast production for onward ten years regarding major fruits including Apple, Citrus, Peach, Plum and Pear in Khyber Pakhtunkhwa, Pakistan. The time series data were collected from secondary sources of various issues of Fruits, Vegetables and Condiments Statistics, Crop Reporting Service of Khyber Pakhtunkhwa and were analyzed in Statistical Package SPSS version 22.

Trend analysis technique provide clear picture of trend so that we can easily forecast the future related production of different crops (Box and Jenkin, 1994; Makridakis, 1998). In literature, several forecasting models have been developed so far to forecast the future values. The study has been carried out by using forecasting models including Linear trend model, Quadratic trend model, Cubic trend model, Power trend model, S-curve model, Logarithmic trend model, Exponential trend model, Compound growth model, Growth curve, Inverse curve, Logistic Curve to find out the best-fitted model for the production of major fruit crops of Khyber Pakhtunkhwa. Trend models are described below in brief.

**Trend models**

- i. **Linear Trend Model:** The linear trend model is used for forecasting trends in the production of major fruit crops. The linear trend model was also used in literature by Boken et al. (2000), Finger (2007), and Rimi et al. (2011) which can be described as follows:

$$Y_t = \beta_0 + \beta_1 t + e_t \text{ --- (1.1)}$$

Where,  $Y_t$  represents the production predicted at time  $t$ ,  $t$  represents the time index,  $\beta_0$  is the intercept of the model  $\beta_1$  is the annual change in production and  $e_t$  is the error term of the model.

- ii. **Quadratic Trend Model:** Quadratic trend model is used to check the trend patterns which was also been applied by Finger (2007). The model equation presented in Equation-(1.2);

$$Y_t = \beta_0 + \beta_1 t + \beta_2 t^2 + e_t \text{ --- (1.2)}$$

Where,  $Y_t$  represents production predicted at period  $t$ ,  $t$  is the time index  $\beta_0$  is the intercept,  $\beta_1$  and  $\beta_2$  represents the annual change in production,  $e_t$  is the error term of the respective model.

- iii. **Exponential Trend Model:** The exponential trend model permits a relationship in which the series increases (decreases) at an increasing (decreasing) rate. The exponential trend model was used in literature by Sorva et. al. (1990) and Pere (2000) is described as follows;

$$Y_t = \beta_0 * \beta_1^t + e_t \text{ --- (1.3)}$$

Here,  $Y_t$  represents predicted production;  $t$  is the time index,  $\beta_0$  is the intercept of the model,  $\beta_1$  is the respective annual change in production and  $e_t$  is the error term of the model.

- iv. **Cubic Trend Model:** Cubic Model was used in literature by Rao et al. (1980) and Wiktor and Travis (1985). It can be defined by the equation

$$Y_t = \beta_0 + \beta_1 * t + \beta_2 * t^2 + \beta_3 * t^3 + e_t \text{ --- (1.4)}$$

Here,  $Y_t$  represents predicted production;  $t$  is the time index,  $\beta_0$  is the intercept of the model,  $\beta_1$ ,  $\beta_2$  and  $\beta_3$  is the respective annual change in production and  $e_t$  is the error term of the model.

- v. **Power Trend Model (PTM):** Power trend model was used by Rao et al. (1980). The PTM can be written in Equation-(1.5);

$$Y_t = \beta_0 * t^{\beta_1} + e_t \text{ --- (1.5)}$$

Where,  $Y_t$  represents production predicted at period  $t$ ,  $t$  is the time index  $\beta_0$  is the intercept,  $\beta_1$  represents the annual change in production,  $e_t$  is the error term of the respective model.

- vi. **Logarithmic Trend Model:** Logarithmic trend model was used in literature by Rao et al. (1980) and Sagar (1980). The equation for the logarithmic trend model can be represented as;

$$Y_t = \beta_0 + \beta_1 * \ln(t) + e_t \text{ --- (1.6)}$$

Here,  $Y_t$  represents the production predicted at time  $t$ ,  $t$  represents the time index,  $\beta_0$  is the intercept of the model,  $\beta_1$  is the annual change in production and  $e_t$  is the error term of the model.

- vii. **Inverse Trend Model:** The Inverse growth model was used in literature by Rao et al. (1980) and Sagar (1980). The equation for Inverse trend model is represented by;

$$Y_t = \beta_0 + \frac{\beta_1}{t} + e_t \text{ --- (1.7)}$$

As,  $Y_t$  represents the production predicted at time  $t$ ,  $t$  represents time index,  $\beta_0$  is the intercept of the model,  $\beta_1$  is the annual change in production and  $e_t$  is the error term of the model.

**viii. Compound Trend Model:** Compound trend model was used in literature by Wiktor and Travis (1985). The equation for the compound trend model can be written as follows;

$$Y_t = \beta_0 * \beta_1^t + e_t \text{ --- (1.8)}$$

Here,  $Y_t$  represents the production predicted at time  $t$ ,  $t$  represents the time index,  $\beta_0$  is the intercept of the model,  $\beta_1$  is the annual change in production and  $e_t$  is the error term of the model.

**Instability Analysis:-** Instability is one of the most important decision parameter in developing fields, specially, in the field of agriculture sector. The wide fluctuation in the crops output not only brings about sharp fluctuation but also results in wide variation in farmer’s income as well. To examine the extent of variability in the production of major fruit crops of Khyber Pakhtunkhwa, the Cuddy-Della Valle Index is used (Cuddy and Della Valle, 1978).

The instability in the production of major fruit crops is measured in relative terms by using the Cuddy- Della Valle index (I), symbolically written as:

$$I = CV * \sqrt{1 - AdR^2} \text{ --- (1.9)}$$

Whereas,

I = Instability index (in percent)

CV = Coefficient of variation (in percent), and

AdR = Coefficient of determination from time trend regression adjusted by the corresponding number of degrees of freedom.

**Results and Discussion**

**1.1-Trend Analysis for Apple Production:** The trend analysis technique is employed to check the best-fitted trend model for Apple fruit production in Khyber Pakhtunkhwa Province of Pakistan by using the SPSS Package. Among the trend models including linear trend model, Quadratic trend model, cubic trend model, compound trend model, exponential trend model, power trend model, S-Curve model, inverse trend model, growth trend model, logarithmic trend model, logistic trend model, etc., the best-fitted model based on Accuracy measures the power trend curve is found to be best-fitted curve presented in Table-1.1 and Figure-1.1.

**Table:1.1:-Results of Trend Model for Apple production**

| Equation    | Accuracy Measures |       |         |      | Parameter Estimates |           |          |    |
|-------------|-------------------|-------|---------|------|---------------------|-----------|----------|----|
|             | R <sup>2</sup>    | MAE   | MSE     | MAPE | Constant            | b1        | b2       | b3 |
| Linear      | 0.54              | 13039 | 2300000 | 15   | 64494.925           | 1677.734  |          |    |
| Logarithmic | 0.659             | 10622 | 7565821 | 19   | 38030.658           | 21427.172 |          |    |
| Inverse     | 0.452             | 15087 | 8994127 | 34   | 103912.48           | 83032.483 |          |    |
| Quadratic   | 0.701             | 10732 | 1500000 | 11   | 42540.802           | 5336.754  | -104.543 |    |

|                    |       |       |          |    |           |          |        |        |
|--------------------|-------|-------|----------|----|-----------|----------|--------|--------|
| <b>Cubic</b>       | 0.718 | 9288  | 9083421  | 10 | 51645.171 | 2424.216 | 100.51 | -3.906 |
| <b>Compound</b>    | 0.551 | 1778  | 8670000  | 11 | 63738.66  | 1.02     |        |        |
| <b>Power</b>       | 0.730 | 5863  | 77971520 | 5  | 45004.794 | 0.269    |        |        |
| <b>S</b>           | 0.553 | 12165 | 20200000 | 13 | 11.549    | -1.097   |        |        |
| <b>Growth</b>      | 0.551 | 7981  | 8571120  | 11 | 11.063    | 0.02     |        |        |
| <b>Exponential</b> | 0.551 | 7724  | 8473220  | 11 | 63738.66  | 0.02     |        |        |
| <b>Logistic</b>    | 0.551 | 7862  | 8200000  | 12 | 0.0000157 | 0.98     |        |        |

The parameter estimate of all selected models presented in Table-1.1 is found to be significant, having  $p \leq 0.05$ . Also, power trend model is found to be the best suitable one among the studied trend models, on the basis of forecast evaluation criteria.

**Figure:1.1:- Power Curve Plot for Apple fruit Production**

Figure-1 shows that the fitted line provides a good fit as it passes through majority of the data points. The ten years forecast for Apple production along with their lower and upper limits with effect from 2014-15 to 2023-24 are recorded in Table-1.2.

**Table 1.2: - Ten Years Forecasts for Apple Production**

| Period  | Forecast | LCL      | UCL      |
|---------|----------|----------|----------|
| 2014-15 | 117317.3 | 86822.95 | 158521.9 |
| 2015-16 | 118211.3 | 87457.18 | 159780   |
| 2016-17 | 119087.3 | 88077.72 | 161014.6 |

|         |          |          |          |
|---------|----------|----------|----------|
| 2017-18 | 119946.3 | 88685.24 | 162226.6 |
| 2018-19 | 120788.8 | 89280.32 | 163417.2 |
| 2019-20 | 121615.8 | 89863.54 | 164587.3 |
| 2020-21 | 122427.7 | 90435.42 | 165737.6 |
| 2021-22 | 123225.4 | 90996.44 | 166869.1 |
| 2022-23 | 124009.2 | 91547.05 | 167982.4 |
| 2023-24 | 124779.9 | 92087.69 | 169078.2 |

From Table 1.2, it is depicted that the forecast of production with effect from the period 2014-15 to 2023-24 shows an increasing trend which indicates that production will increase with respect to time.

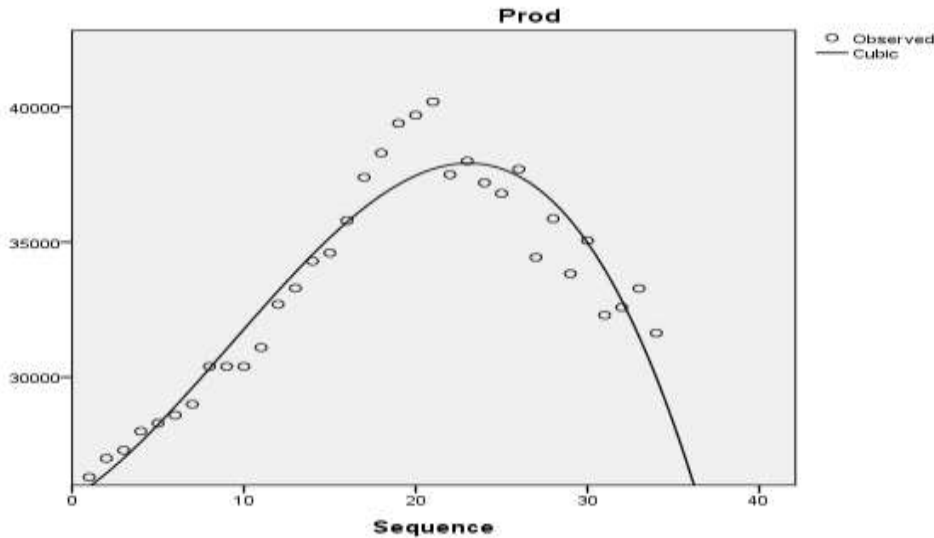

**2.1: -Trend Analysis for Citrus Production:** The trend analysis for Citrus fruit production is performed to check the best-fitted trend models among the described above models and it has been found that the cubic trend model is the best-fitted model based on Accuracy measures. The trend curve and its corresponding parameter estimates are given in Table 2.1 and Figure 2.1.

**Table 2.1:- Results of Trend Model for Citrus Production**

| Equation           | Accuracy Measures |      |         |       | Parameter Estimates |           |         |        |

| <b>Exponential</b> | 0.414             | 2589 | 1036698 | 12    | 28992.764           | 0.008     |         |        |

|                 |           |      |              |    |               |       |  |  |
|-----------------|-----------|------|--------------|----|---------------|-------|--|--|
| <b>Logistic</b> | 0.41<br>4 | 2579 | 1006791<br>6 | 13 | 0.00003<br>45 | 0.992 |  |  |
|-----------------|-----------|------|--------------|----|---------------|-------|--|--|

The parameter estimates of all the selected models presented in Table-2.1 are found to be significant at 5% level of significance. Also, the cubic trend model is found to be best suitable model among the studied trend models, on the basis of forecast evaluation criteria.

**Figure:2.1:- Cubic Curve Plot for Citrus fruit Production**

From Figure-2.1, it is depicted that the fitted line provides a good fit as it passes through majority of the data points.

Ten years forecast along with their lower and upper confidence limits for Citrus fruit production with effect from 2014-15 to 2023-24 and lower and upper confidence limits are found and presented in Table-2.2.

**Table-2.2:- Ten Years Forecast for Citrus Production**

| Period  | Forecast | LCL      | UCL      |
|---------|----------|----------|----------|
| 2014-15 | 28298.94 | 25045.83 | 31552.06 |
| 2015-16 | 26406.55 | 22849.01 | 29964.1  |
| 2016-17 | 24310.93 | 20360.26 | 28261.59 |
| 2017-18 | 22004.46 | 17567.23 | 26441.7  |
| 2018-19 | 19479.57 | 14459.79 | 24499.35 |
| 2019-20 | 16728.64 | 11029.06 | 22428.23 |
| 2020-21 | 13744.1  | 7266.605 | 20221.59 |
| 2021-22 | 10518.33 | 3163.966 | 17872.7  |
| 2022-23 | 7043.749 | -1287.6  | 15375.09 |
| 2023-24 | 3312.754 | -6097.17 | 12722.68 |

From Table 2.2, ten ten-year forecasts for Citrus production with effect from 2014-15 to 2023-2024, represents a decreasing trend.

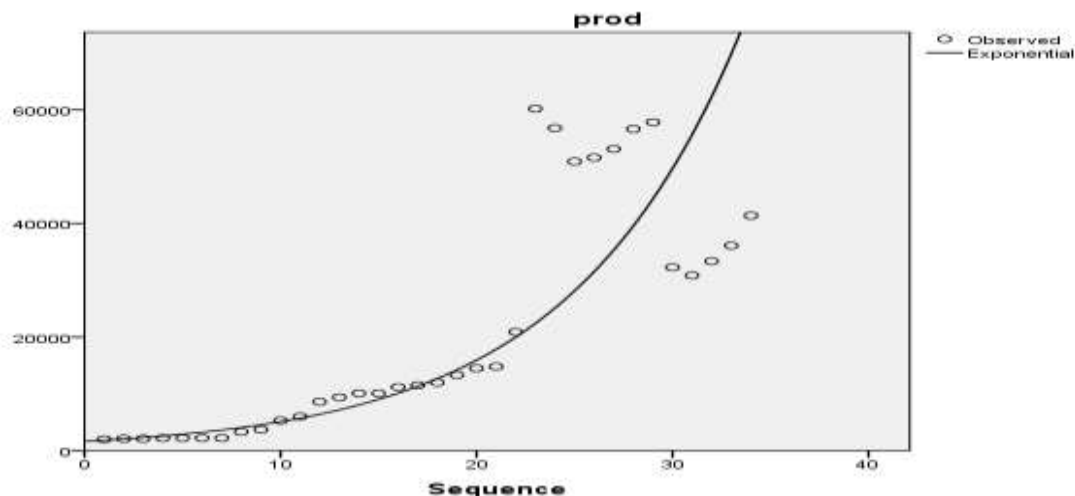

**3.1-Trend Analysis for Peach Production:** The trend analysis of Plum fruit production is performed to check the best-fitted trend models among the described above models in which it has been found that the exponential trend model is the best-fitted model based on Accuracy measures. The trend curve and its parameter estimates are presented in Table 3.1 and Figure-3.1

**Table-3.1:- Results of Trend Model for Peach Production**

| Equation           | Accuracy Measures |       |           |      | Parameter Estimates |            |         |        |

| <b>S</b>           | 0.366             | 8129  | 164386655 | 28   | 9.87                | -3.95      |         |        |
| <b>Growth</b>      | 0.889             | 3345  | 248437260 | 23   | 7.401               | 0.114      |         |        |
| <b>Exponential</b> | 0.889             | 3341  | 238437250 | 23   | 1637.125            | 0.114      |         |        |
| <b>Logistic</b>    | 0.889             | 9545  | 248477260 | 31   | 0.001               | 0.892      |         |        |

From Table-3.1, it is showed that parameter estimates of all the selected models are found to be significant at 5% level of significance. Also, the exponential trend model is calculated to be best suitable model among the studied trend models, based on forecast evaluation criteria.

**Figure-3:- Exponential Curve Plot for Peach Production**

Figure 3.1 shows that the fitted trend line provides a good fit as compared to other selected models and it passes through majority of the data points.

Ten-year forecasts with their respective lower and upper confidence limits for Peach fruit production with effect from 2014-15 to 2023-24 are recorded in Table 3.2.

**Table 3.2:- Ten Years Forecasts for Peach Production**

| Period  | Forecast | LCL      | UCL      |
|---------|----------|----------|----------|
| 2014-15 | 87744.5  | 36542.35 | 210689.7 |
| 2015-16 | 98315.92 | 40770.09 | 237086.1 |
| 2016-17 | 110161   | 45477.16 | 266847   |
| 2017-18 | 123433.1 | 50716.93 | 300407.3 |
| 2018-19 | 138304.3 | 56548.6  | 338259.1 |
| 2019-20 | 154967.1 | 63037.89 | 380958.4 |
| 2020-21 | 173637.5 | 70257.68 | 429134.4 |
| 2021-22 | 194557.3 | 78288.85 | 483498.5 |
| 2022-23 | 217997.5 | 87221.07 | 544855.7 |
| 2023-24 | 244261.7 | 97153.84 | 614116.7 |

From Table 3.2, the ten-year forecast for peach production is found to be increasing with effect from 2014-15 to 2023-24 i.e. represents an increasing trend.

**4.1 Trend Analysis for Pear Production:** The trend analysis of Pear fruit production is performed to check the best-fitted trend models among the studied models and it has been found that the cubic trend model is the best-fitted model based on Accuracy measures. The trend curve and its parameter estimates are given in Table 4.1 and Figure 4.1.

**Table:4.1:-Results of Trend Model for Pear Production**

| Equation | Accuracy Measures |     |     |      | Parameter Estimates |    |    |    |
|----------|-------------------|-----|-----|------|---------------------|----|----|----|
|          | R <sup>2</sup>    | MAE | MSE | MAPE | Constant            | b1 | b2 | b3 |

|                    |           |      |              |    |               |                   |                 |               |

| <b>Power</b>       | 0.17<br>7 | 5123 | 2314312<br>4 | 18 | 35712.78<br>1 | -0.094            |                 |               |
| <b>S</b>           | 0.02<br>7 | 5312 | 2844231<br>2 | 32 | 10.217        | 0.173             |                 |               |
| <b>Growth</b>      | 0.43<br>6 | 3306 | 1511997<br>6 | 11 | 10.462        | -0.013            |                 |               |
| <b>Exponential</b> | 0.43<br>6 | 3306 | 1511997<br>6 | 12 | 34947.81<br>6 | -0.013            |                 |               |
| <b>Logistic</b>    | 0.43<br>6 | 3121 | 1511997<br>6 | 13 | 0.000028<br>6 | 1.013             |                 |               |

From Table-4.1, the parameter estimates of all selected model is found to be significant except Inverse trend model and S-curve trend model at 5% level of significance. Also, cubic trend model is found to be best suitable model among the studied trend models, based on forecast evaluation criteria.

**Table-4.2:-Ten Years Forecast for Pear Production**

| Period  | Forecast | LCL      | UCL      |
|---------|----------|----------|----------|
| 2014-15 | 12305.78 | 7792.359 | 16819.21 |
| 2015-16 | 9664.845 | 4729.053 | 14600.64 |
| 2016-17 | 6810.508 | 1329.29  | 12291.73 |
| 2017-18 | 3735.206 | -2421.09 | 9891.5   |
| 2018-19 | 431.3788 | -6533.15 | 7395.904 |
| 2019-20 | -3108.54 | -11016.2 | 4799.163 |
| 2020-21 | -6892.1  | -15879.1 | 2094.875 |
| 2021-22 | -10926.9 | -21130.5 | -723.319 |
| 2022-23 | -15220.4 | -26779.5 | -3661.4  |
| 2023-24 | -19780.3 | -32835.8 | -6724.86 |

The forecast for pear production presented in Table 4.2 shows decreasing trend with effect from 2014-15 to 2023-24.

**5.1-Trend Analysis for Plum Production:** The trend analysis of Plum fruit production is performed to check the best-fitted trend models among the different trend models by which it has been found that the cubic trend model is the best-fitted model based on Accuracy measures. Trend curves and their parameter estimates are given below in Table 5.1 and Figure 5.1.

**Table-5.1:-Results of Trend Model for Plum Production**

| Equation           | Accuracy Measures |      |          |      | Parameter Estimates |          |         |        |
|--------------------|-------------------|------|----------|------|---------------------|----------|---------|--------|
|                    | R <sup>2</sup>    | MAE  | MSE      | MAPE | Constant            | b1       | b2      | b3     |
| <b>Linear</b>      | 0.014             | 3381 | 15261275 | 11   | 31794.877           | 47.505   |         |        |
| <b>Logarithmic</b> | 0.13              | 3032 | 13241432 | 12   | 28266.351           | 1673.444 |         |        |
| <b>Inverse</b>     | 0.168             | 2865 | 12756423 | 18   | 33703.486           | -8894.04 |         |        |
| <b>Quadratic</b>   | 0.802             | 1405 | 3060837  | 4    | 23263.365           | 1469.423 | -40.626 |        |
| <b>Cubic</b>       | 0.871             | 1373 | 2519574  | 4    | 26517.75            | 428.327  | 32.671  | -1.396 |
| <b>Compound</b>    | 0.011             | 3410 | 15336119 | 11   | 31672.033           | 1.001    |         |        |
| <b>Power</b>       | 0.126             | 3321 | 13217234 | 9    | 28372.56            | 0.051    |         |        |
| <b>S</b>           | 0.174             | 3125 | 13123452 | 10   | 10.419              | -0.279   |         |        |
| <b>Growth</b>      | 0.011             | 3411 | 15336119 | 11   | 10.363              | 0.001    |         |        |
| <b>Exponential</b> | 0.011             | 3410 | 15336119 | 11   | 31672.033           | 0.001    |         |        |
| <b>Logistic</b>    | 0.011             | 3399 | 15437212 | 13   | 0.0000316           | 0.999    |         |        |

The parameter estimates of the selected models are significant except linear trend model, compound trend model, growth trend model, exponential trend model and logistic trend model. Also, the cubic trend model is calculated to be best suitable model on the basis of forecast evaluation criteria among the studied trend models.

**Figure: 5.1:- Cubic Curve for Plum Fruit Production**

Figure 5.1 shows that the fitted line provides the good fit as it passes through the majority of the data points as compared to others among the studied trend curves.

Ten years forecast for Plum fruit production with effect from 2014-15 to 2023-24 and the upper and lower confidence limits are presented in Table-5.2.

**Table 5.2:- Ten Years Forecasts for Plum Production**

| Period  | Forecast | LCL      | UCL      |
|---------|----------|----------|----------|
| 2014-15 | 21671.64 | 17794.05 | 25549.23 |
| 2015-16 | 19140.81 | 14900.35 | 23381.27 |
| 2016-17 | 16373.75 | 11664.71 | 21082.8  |
| 2017-18 | 13362.1  | 8073.081 | 18651.12 |
| 2018-19 | 10097.47 | 4114.08  | 16080.86 |
| 2019-20 | 6571.489 | -222.208 | 13365.19 |
| 2020-21 | 2775.775 | -4945.16 | 10496.71 |
| 2021-22 | -1298.05 | -10064.2 | 7468.086 |
| 2022-23 | -5658.35 | -15589   | 4272.303 |
| 2023-24 | -10313.5 | -21529.8 | 902.7602 |

From the forecast for plum production presented in Table-5.2 shows that production is on decreasing with effect from 2014-15 to 2023-24.

**6.1:-Variability Analysis of Major Fruits Production in Khyber Pakhtunkhwa**

The variability of major fruit production has a pivotal role in sustainable production as well as for the economy of the country. Therefore, an effort has been made to estimate the relative variability in major fruit production presented in Table 6.1.

**Table-6.1:- Variability Index of Major Fruits of Khyber Pakhtunkhwa**

| Fruit Crop | CV (%) | AdR <sup>2</sup> | Variability Index (I) = CV * $\sqrt{1 - AdR^2}$ |
|------------|--------|------------------|---|
| Apple      | 24.217 | 0.989659         | 2.462644  |
| Citrus     | 11.798 | 0.999464         | 0.273143  |
| Peach      | 95.236 | 0.936107         | 24.07287  |
| Pear       | 17.085 | 0.983365         | 2.203568  |
| Plum       | 12.24  | 0.995346         | 0.835016  |

The variability in production of major fruits of Khyber Pakhtunkhwa is estimated for period 1980-81 to 2013-14. It is observed that among all five major fruits i.e. apple, citrus, peach, pear, plum, the production of peach possesses highest variability (24.07%) whereas; the citrus production has the least variability (0.27%).

### Conclusions and Recommendations:

The instant results suggest that trend analysis for each major fruit production provides a clear picture of the trend. The cubic trend model was found suitable for forecasting major fruits i.e. citrus, pear, and plum except for apple and peach fruit in which the Power trend model and Exponential trend model were found suitable. Moreover, variability analysis of peach fruit production was recorded to be highest i.e. 24.07%, as compared to other fruit crops under study and citrus possess the least variability i.e. 0.27% due to fluctuating results of crop acreage, area and productivity. Also, variability analysis of apple, pear, and plum was calculated to be 2.46%, 2.20%, and 0.84% respectively. Therefore, it can be suggested that these selected models could be used by researchers, businessmen, policymakers, and fruit producers for information, planning their resources as well as decision making regarding fruit production in Khyber Pakhtunkhwa.
